Rotation of Axes

The problems for Section 12.8 are to be solved by using the transformation equations for moments and products of inertia.

Problem 12.8-1 Determine the moments of inertia I_{x_1} and I_{y_1} and the product of inertia $I_{x_1 y_1}$ for a square with sides b , as shown in the figure. (Note that the $x_1 y_1$ axes are centroidal axes rotated through an angle θ with respect to the xy axes.)

Solution 12.8-1 Rotation of axes

FOR A SQUARE:
 $I_x = I_y = \frac{b^4}{12} \quad I_{xy} = 0$

EQ. (12-25):

$$I_{x_1} = \frac{I_x + I_y}{2} + \frac{I_x - I_y}{2} \cos 2\theta - I_{xy} \sin 2\theta = \frac{I_x + I_y}{2} + 0 - 0 = \frac{b^4}{12} \quad \leftarrow$$

EQ. (12-29):

$$I_{x_1} + I_{y_1} = I_x + I_y \quad \therefore I_{y_1} = \frac{b^4}{12} \quad \leftarrow$$

EQ. (12-27):

$$I_{x_1 y_1} = \frac{I_x - I_y}{2} \sin 2\theta + I_{xy} \cos 2\theta = 0 \quad \leftarrow$$

Since θ may be any angle, we see that all moments of inertia are the same and the product of inertia is always zero (for axes through the centroid C).

Problem 12.8-2 Determine the moments and product of inertia with respect to the x_1y_1 axes for the rectangle shown in the figure. (Note that the x_1 axis is a diagonal of the rectangle.)

Solution 12.8-2 Rotation of axes (rectangle)

CASE 1:

$$I_x = \frac{bh^3}{12} \quad I_y = \frac{hb^3}{12} \quad I_{xy} = 0$$

ANGLE OF ROTATION:

$$\cos \theta = \frac{b}{\sqrt{b^2 + h^2}} \quad \sin \theta = \frac{h}{\sqrt{b^2 + h^2}}$$

$$\cos 2\theta = \cos^2 \theta - \sin^2 \theta = \frac{b^2 - h^2}{b^2 + h^2}$$

$$\sin 2\theta = 2 \sin \theta \cos \theta = \frac{2bh}{b^2 + h^2}$$

SUBSTITUTE INTO EQS. (12-25), (12-29), AND (12-27) AND SIMPLIFY:

$$I_{x_1} = \frac{b^3h^3}{6(b^2 + h^2)} \quad \longleftarrow \quad I_{y_1} = \frac{bh(b^4 + h^4)}{12(b^2 + h^2)} \quad \longleftarrow$$

W 12 \times 50 $I_x = 394 \text{ in.}^4$
 $I_y = 56.3 \text{ in.}^4$ $I_{xy} = 0$
 Depth $d = 12.19 \text{ in.}$
 Width $b = 8.080 \text{ in.}$

$$\tan \theta = \frac{d}{b} = \frac{12.19}{8.080} = 1.509$$

$$\theta = 56.46^\circ \quad 2\theta = 112.92^\circ$$

Eq. (12-25):

$$\begin{aligned} I_d &= \frac{I_x + I_y}{2} + \frac{I_x - I_y}{2} \cos 2\theta - I_{xy} \sin 2\theta \\ &= \frac{394 + 56.3}{2} + \frac{394 - 56.3}{2} \cos (112.92^\circ) - 0 \\ &= 225 \text{ in.}^4 - 66 \text{ in.}^4 = 159 \text{ in.}^4 \quad \longleftarrow \end{aligned}$$

Principal Axes, Principal Points, and Principal Moments of Inertia

Problem 12.9-1 An ellipse with major axis of length $2a$ and minor axis of length $2b$ is shown in the figure.

(a) Determine the distance c from the centroid C of the ellipse to the principal points P on the minor axis (y axis).

(b) For what ratio a/b do the principal points lie on the circumference of the ellipse?

(c) For what ratios do they lie inside the ellipse?

Solution 12.9-1 Principal points of an ellipse

(a) LOCATION OF PRINCIPAL POINTS

At a principal point, all moments of inertia are equal.

At point P_1 : $I_{x_p} = I_y$ Eq. (1)

From Case 16: $I_y = \frac{\pi b a^3}{4}$

$$I_x = \frac{\pi a b^3}{4} \quad A = \pi a b$$

Parallel-axis theorem:

$$I_{x_p} = I_x + A c^2 = \frac{\pi a b^3}{4} + \pi a b c^2$$

Substitute into Eq. (1):

$$\frac{\pi a b^3}{4} + \pi a b c^2 = \frac{\pi b a^3}{4}$$

Solve for c : $c = \frac{1}{2} \sqrt{a^2 - b^2}$ ←

(b) PRINCIPAL POINTS ON THE CIRCUMFERENCE

$$\therefore c = b \text{ and } b = \frac{1}{2}\sqrt{a^2 - b^2}$$

Solve for ratio $\frac{a}{b}$: $\frac{a}{b} = \sqrt{5}$ ←

(c) PRINCIPAL POINTS INSIDE THE ELLIPSE

$$\therefore 0 \leq c < b \quad \text{For } c = 0: \quad a = b \text{ and } \frac{a}{b} = 1$$

$$\text{For } c = b: \quad \frac{a}{b} = \sqrt{5}$$

$$\therefore 1 \leq \frac{a}{b} < \sqrt{5} \quad \leftarrow$$

Problem 12.9-2 Demonstrate that the two points P_1 and P_2 , located as shown in the figure, are the principal points of the isosceles right triangle.

Solution 12.9-2 Principal points of an isosceles right triangle

CONSIDER POINT P_1 :

$I_{x_1 y_1} = 0$ because y_1 is an axis of symmetry.

$I_{x_2 y_2} = 0$ because areas 1 and 2 are symmetrical about the y_2 axis and areas 3 and 4 are symmetrical about the x_2 axis.

Two different sets of principal axes exist at point P_1 .

$\therefore P_1$ is a principal point ←

CONSIDER POINT P_2 :

$I_{x_3 y_3} = 0$ because y_3 is an axis of symmetry.

$I_{x_2 y_2} = 0$ (see above).

Parallel-axis theorem:

$$I_{x_2 y_2} = I_{x_c y_c} + Ad_1 d_2 \quad A = \frac{b^2}{4} \quad d = d_1 = d_2 = \frac{b}{6\sqrt{2}}$$

$$I_{x_c y_c} = -\left(\frac{b^2}{4}\right)\left(\frac{b}{6\sqrt{2}}\right)^2 = -\frac{b^4}{288}$$

Parallel-axis theorem:

$$I_{x_4 y_4} = I_{x_c y_c} + Ad_1 d_2 \quad d_1 = d_2 = -\frac{b}{6\sqrt{2}}$$

$$I_{x_4 y_4} = -\frac{b^4}{288} + \frac{b^2}{4}\left(-\frac{b}{6\sqrt{2}}\right)^2 = 0$$

Two different sets of principal axes ($x_3 y_3$ and $x_4 y_4$) exist at point P_2 .

$\therefore P_2$ is a principal point ←

$$I_{x_c y_c} = -4.28696 \text{ in.}^4$$

PRINCIPAL AXES

$$\text{Eq. (12-30):} \quad \tan 2\theta_p = -\frac{2I_{xy}}{I_x - I_y} = -0.54380$$

$$2\theta_p = -28.5374^\circ \text{ and } 151.4626^\circ$$

$$\theta_p = -14.2687^\circ \text{ and } 75.7313^\circ$$

SUBSTITUTE into Eq. (12-25) with $\theta = -14.2687^\circ$

$$I_{x_1} = 2.1223 \text{ in.}^4$$

SUBSTITUTE into Eq. (12-25) with $\theta = 75.7313^\circ$

$$I_{x_2} = 20.0695 \text{ in.}^4$$

THEREFORE,

$$I_1 = 20.07 \text{ in.}^4 \quad \theta_{p_1} = 75.73^\circ$$

$$I_2 = 2.12 \text{ in.}^4 \quad \theta_{p_2} = -14.27^\circ$$

NOTE: The principal moments of inertia I_1 and I_2 can be verified with Eqs. (12-33a and b) and Eq. (12-29).
